Generated at: 2025-12-24 15:34:59

Problem:

You are given an array `apple` of size `n` and an array `capacity` of size `m`.

There are `n` packs where the i^{th} pack contains `apple[i]` apples. There are `m` boxes as well, and the i^{th} box has a capacity of `capacity[i]` apples.

Return *the **minimum** number of boxes you need to select to redistribute these* `n` *packs of apples into boxes*.

Note that, apples from the same pack can be distributed into different boxes.

Example 1:

```
Input: apple = [1,3,2], capacity = [4,3,1,5,2]
Output: 2
Explanation: We will use boxes with capacities 4 and 5.
It is possible to distribute the apples as the total capacity is greater than or equal to the total number of
apples.
```

Example 2:

```
Input: apple = [5,5,5], capacity = [2,4,2,7]
Output: 4
Explanation: We will need to use all the boxes.
```

Constraints:

- `1 <= n == apple.length <= 50`
- `1 <= m == capacity.length <= 50`
- `1 <= apple[i], capacity[i] <= 50`
- The input is generated such that it's possible to redistribute packs of apples into boxes.
