Problem:

You are given an integer array `nums` and an integer `target` .

Return the number of **subarrays** of `nums` in which `target` is the **majority element**.

The **majority element** of a subarray is the element that appears **strictly more than half** of the times in that subarray.

Example 1:

Input: `nums = [1,2,2,3]`, `target = 2`

Output: 5

Explanation:

Valid subarrays with `target = 2` as the majority element:

- `nums[1..1] = [2]`
- `nums[2..2] = [2]`
- `nums[1..2] = [2,2]`

- `nums[0..2] = [1,2,2]`
- `nums[1..3] = [2,2,3]`

So there are 5 such subarrays.

Example 2:

Input: `nums = [1,1,1,1]`, `target = 1`

Output: 10

Explanation:

All 10 subarrays have 1 as the majority element.

Example 3:

Input: `nums = [1,2,3]`, `target = 4`

Output: 0

Explanation:

`target = 4` does not appear in `nums` at all. Therefore, there cannot be any subarray where 4 is the majority element. Hence the answer is 0.

Constraints:

- `1 <= nums.length <= 1000`
- `1 <= nums[i] <= 109`

- $1 \leq \text{target} \leq 10^9$
