Problem:

Given an array of strings `patterns` and a string `word`, return *the **number** of strings in `patterns` that exist as a **substring** in `word`*.

A **substring** is a contiguous sequence of characters within a string.

Example 1:

```
Input: patterns = ["a","abc","bc","d"], word = "abc"
```

```
Output: 3
```

```
Explanation:
```

- "a" appears as a substring in "abc".
 - "abc" appears as a substring in "abc".
 - "bc" appears as a substring in "abc".
 - "d" does not appear as a substring in "abc".
- 3 of the strings in patterns appear as a substring in word.

Example 2:

Input: patterns = ["a","b","c"], word = "aaaaabbbbb"

Output: 2

Explanation:

- "a" appears as a substring in "aaaaabbbbb".
- "b" appears as a substring in "aaaaabbbb".
- "c" does not appear as a substring in "aaaaabbbbb".

2 of the strings in patterns appear as a substring in word.

Example 3:

Input: patterns = ["a","a","a"], word = "ab"

Output: 3

Explanation: Each of the patterns appears as a substring in word "ab".

Constraints:

- $1 \leq \text{patterns.length} \leq 100$
- $1 \leq \text{patterns}[i].\text{length} \leq 100$
- $1 \leq \text{word.length} \leq 100$
- `patterns[i]` and `word` consist of lowercase English letters.
