Problem:

You are given a binary array `nums` (**0-indexed**).

We define x_i as the number whose binary representation is the subarray `nums[0..i]` (from most-significant-bit to least-significant-bit).

- For example, if `nums = [1,0,1]`, then $x_0 = 1$, $x_1 = 2$, and $x_2 = 5$.

Return an array of booleans `answer` where `answer[i]` is `true` if x_i is divisible by 5.

Example 1:

Input: `nums = [0,1,1]`

Output: `[true,false,false]`

Explanation: The input numbers in binary are 0, 01, 011; which are 0, 1, and 3 in base-10. Only the first number is divisible by 5, so `answer[0]` is true.

Example 2:

Input: `nums = [1,1,1]`

Output: `[false,false,false]`

Constraints:

- `1 <= nums.length <= 105`
- `nums[i]` is either `0` or `1` .
